

AN INTRO TO BUSINESS CENTRAL DEVELOPMENT & DELIVERY

TOBIAS FENSTER

MANAGING DIRECTOR @ 4PS GERMANY CHIEF ENGINEER @ HILTI

AZURE MVP & REGIONAL DIRECTOR DOCKER CAPTAIN

This is meant for people new to or interested in Business Central development and delivery. If you already know how this works, you probably won't learn a lot.

Development in BC (and NAV)

General approach (past and present)

Customer code

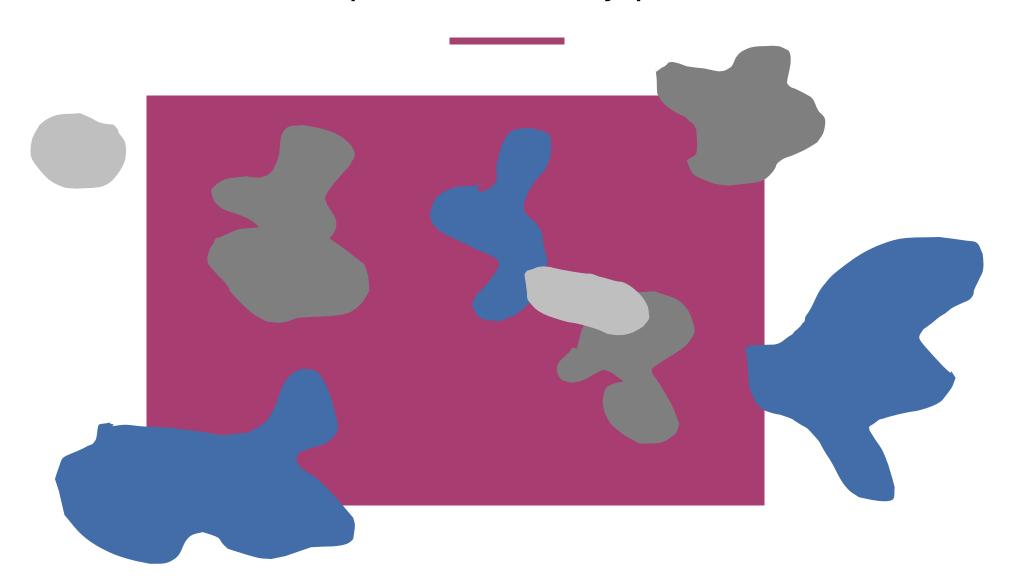

Partner(s) code

Local Microsoft code (DE, UK, ...)

International Microsoft code

Implementation reality (past)

Implementation reality (present)

- You can't change or remove Microsoft code, you can only extend it
 - With a few exceptions
 - And a concept to replace whole "modules" if they are designed for it
- You can create for the whole world (AppSource) or for a customer ("Per Tenant Extension" PTE)
 - But you must say which localizations you support
- Overall a lot cleaner, better to understand and maintain
 - But also more limited

General structure

- Business Central with classic 3-tier architecture: database, middle/application layer, (web) client
- Code is imported into the database, middle layer generates C# code, SQL structures, front end
- Because of generative approach, developer has far-reaching, but not complete influence on all layers

Tooling (past): C/SIDE

```
Codeunit 50000 CrlnvForCust10000And70000 - C/AL Editor
                                                                                                                     ■ Documentation()

■ OnRun()

  ■ LOCAL CreateInvoiceDocument(VAR SalesHeader : Record "Sales Header")
    WITH SalesHeader DO BEGIN
      INIT:
      "Document Type" := "Document Type"::Invoice;
      "No." := '';
      INSERT(TRUE);
    END:
  ■ LOCAL TestIfCustomerIsBlocked()
    WITH Customer DO BEGIN
     GET('10000');
     TESTFIELD(Blocked, Blocked::" ");
    END;
  ■ LOCAL SelectCustomer10000(VAR SalesHeader : Record "Sales Header")
    WITH SalesHeader DO
     VALIDATE("Sell-to Customer No.", '10000');
  ■ LOCAL SaveHeaderToDatabase(VAR SalesHeader : Record "Sales Header")
    WITH SalesHeader DO
      MODIFY(TRUE);
  ■ LOCAL CreateSalesLine(VAR SalesHeader : Record "Sales Header";VAR SalesLine : Record "Sales Line")

■ LOCAL TestIfItemIsBlocked()

■ LOCAL SelectItem70000(VAR SalesLine : Record "Sales Line")

■ LOCAL SaveLineToDatabase(VAR SalesLine : Record "Sales Line")

  ■ LOCAL OpenSalesInvoicePage(VAR SalesHeader : Record "Sales Header")
```

Tooling (present): VS Code + AL extension

```

Development language (C/)AL

- 4th generation programming language ("4GL") with a much more generative approach than 3GL (C#, Java, Pascal, ...)
 - Developer writes business code, engine generates backend (C#) / frontend (HTML, JavaScript etc) code
- Optimised for the development of application logic
- Very quick to learn, relatively easy to use
 - But like everywhere else, it takes talent and hard work to be above average...
- Pascal-like syntax
- Past C/AL, present AL

Objects in AL

- Objects in Business Central != Object-orientation (OOP) in other languages
- Code and structures are stored in different object types:
 - Tables (correspond to tables on SQL Server)
 - Pages (UI for displaying data, among other things)
 - Codeunits ("containers" for business logic, roughly comparable to DLLs)
 - Others for different purposes (reports, XML ports, profiles, ...)

DEMO: Development

Delivery in BC (and NAV)

General approach (past)

- Very manual process
 - Develop in your local database (not file based, no real version control!)
 - Extract the changed objects into a file (".fob")
 - Connect to the target environment
 - Import the .fob file
- Could be automated in pipelines, but very cumbersome and with ugly workarounds

General approach (present)

- File-based development, resulting in modular .app packages
- Build in build pipelines
 - AL-Go by Microsoft works in GitHub
 - ALOps works on Azure DevOps
 - COSMO Alpaca works on Azure DevOps and GitHub (and provides development environments)
- Release publicly available solutions to AppSource
- Release customer-individual solutions directly to customer environments
 - Also possible directly from VS Code, but you shouldn't...

General approach (present)

- Test automation as part of the code
 - Typically run in pipelines as well
- Relatively new feature: page scripting
 - Non-technical people record steps they take in the client
 - Results in YAML files describing the steps
 - Can be exported and imported into other environments
 - Can run in pipelines as well

DEMO: Delivery

THANK YOU, YOU ARE AWESOME •
